HTML Structure

What is HTML Structure?

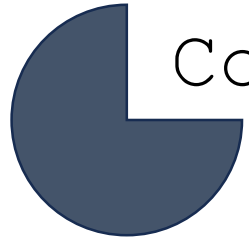

HTML structure refers to the **organized layout** of HTML elements (tags) that make up the **framework of a web page**. It tells the browser what content to display and how it's arranged.

HTML = HyperText Markup Language

HyperText: Text with links (hyperlinks) to other text or documents

Markup Language: A system for annotating a document in a way that's syntactically distinguishable from the text

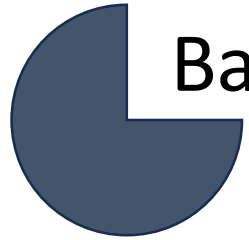

Common HTML Tags in Structure:

Tag	Purpose
<code><html></code>	Root element that wraps entire page
<code><head></code>	Contains metadata and settings
<code><body></code>	Holds all visible content (text, images)

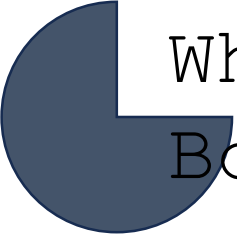

Basic HTML Document Structure :

```
<!DOCTYPE html>
<html>
  <head>
    <title>My Web Page</title>
  </head>
  <body>
    <h1>Welcome!</h1>
    <p>This is a basic web
page.</p>
  </body>
</html>
```

Boilerplate Code

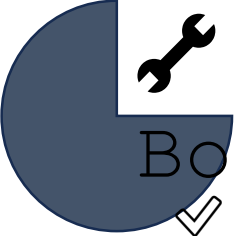

What is an HTML Boilerplate?

An **HTML boilerplate** is a pre-written, standardized **starter template** of HTML code that acts as the foundation for every new HTML document. It includes all the essential tags and structures required to build a modern and valid web page from scratch.

Think of it as the **blank canvas** or **starter kit** for your website – it ensures your page follows best practices and is ready for further development

Why Do We Use a Boilerplate?

✓ **Saves Time:**

You don't need to write the basic structure repeatedly.

✓ **Avoids Errors:**

Helps you avoid missing important elements like `<!DOCTYPE html>`, `<meta>` tags, or the `<title>` tag.

✓ **Ensures Consistency:**

Gives every web page a consistent starting format.

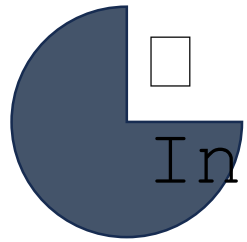

✓ **Follows Best Practices:**

Most boilerplates include recommended tags for SEO, mobile responsiveness, and browser compatibility.

✓ **Beginner-Friendly:**

Especially helpful for beginners as it gives a ready-to-use base to start learning or building.

□ What Does a Typical Boilerplate Include?

Element	Purpose
<code><!DOCTYPE html></code>	Declares that the document is using HTML5
<code><html lang="en"></code>	Specifies the language of the content
<code><head></code>	Includes meta tags, title, and links to stylesheets
<code><meta charset="UTF-8"></code>	Defines character encoding for universal language support
<code><meta name="viewport"...></code>	Ensures mobile responsiveness
<code><title></code>	Sets the title shown in browser tab
<code><body></code>	Container for all visible content

Example of a Basic HTML5 Boilerplate:

```
<!DOCTYPE html>

<html lang="en">

<head>

  <meta charset="UTF-8">

  <meta name="viewport" content="width=device-width, initial-
scale=1.0">

  <meta http-equiv="X-UA-Compatible" content="IE=edge">

  <title>My First Web Page</title>

</head>

<body>

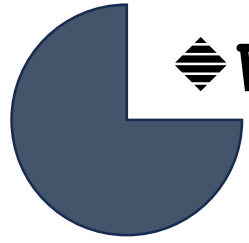

</body>

</html>
```

Doctype

◆ What is Doctype?

The Doctype declaration is a special instruction that must appear at the very top of an HTML document – before the `<html>` tag.

In HTML5, it looks
like this:

```
<!DOCTYPE html>
```

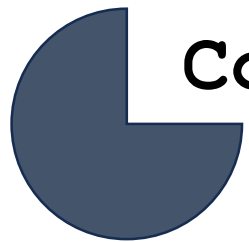

Meta Tag

What are Meta Tags?

- Tags that describe your page to browsers/ search engines.
- Placed inside the <head>
- Invisible to users
- Help with SEO, mobile view, social sharing, and more.

Common Meta Tags Example

- `<meta charset="UTF-8">`
- `<meta name="viewport" content="width=device-width, initial-scale=1.0">`
- `<meta name="description" content="Learn HTML Basics">`
- `<meta name="author" content="Ritesh Thakur">`

Importance of Meta Tags

- ✓ Improve SEO and search visibility
- 📱 Ensure mobile responsiveness
- 🔤 Allow proper text rendering
- 🔒 Help with browser behavior and indexing

That's All for Today
