

Hyperlinks and Image Embedding in HTML

Today's Topics

- ❖ What are hyperlinks?
- ❖ Types of hyperlinks
- ❖ How the `<a>` tag works
- ❖ Difference between absolute and relative URLs
- ❖ Opening links in new tabs/windows
- ❖ Embedding images using `<img>` tag
- ❖ Role of alt, width, and height
- ❖ Combining images with hyperlinks

What is a Hyperlink?

- A **hyperlink** is a reference in HTML that allows users to **jump to a new document, page, section, or resource.**
- Hyperlinks are fundamental to **web navigation**, forming the basis of how the World Wide Web connects informat

They can point to:

- Another page (internal or external)
- Email address or phone number
- Specific section in the same document

HTML Anchor Tag (<a>)

- The **anchor tag** (<a>) is used to create hyperlinks.
- It requires the href attribute to define the link.

Syntax:

```
<a href="https://www.google.com">Visit Google</a>
```

- The clickable part is called the **link text**.
- Browsers often underline hyperlinks and color them blue by default.

Types of Hyperlinks

1. **Text Hyperlinks:** Links applied to text content.
2. **Image Hyperlinks:** Clicking an image redirects to another page.
3. **Email Hyperlinks:** Triggers the default mail application.
4. **Phone Links:** Initiates a call on mobile.
5. **Internal Page Links:** Navigate to specific sections on the same webpage using id.

Absolute vs Relative URLs

- **Absolute URL:** A full path including domain.
 - Example: `https://www.example.com/about.html`
 - Useful for linking to external websites.
- **Relative URL:** Path relative to current file location.
 - Example: `about.html` or `images/photo.jpg`
 - Ideal for linking internal pages or files within the same site
- **Why this matters:**
 - It affects website portability, loading behavior, and project

Opening Links in New Tabs

➤ Use the target attribute to control where the link opens.

➤ Syntax:

```
<a href="https://openai.com" target="_blank">OpenAI</a>
```

➤ **_blank**: Opens in new tab/window

➤ **_self** (default): Opens in the same tab

➤ Important for **user experience and navigation**

Email and Telephone Hyperlinks

➤ **Email:**

```
<a href="mailto:help@support.com">Email Us</a>
```

➤ **Phone:**

```
<a href="tel:+911234567890">Call Now</a>
```

Internal Page Links (Anchors)

- You can navigate to a section on the same page using the id attribute.
- Useful for **long pages** or **single-page websites**.
- **Syntax:**

```
<a href="#contact">Go to Contact</a>
```

```
...
```

```
<h2 id="contact">Contact Us</h2>
```

- Enhances **usability** and supports accessibility.

What is Image Embedding?

- Embedding means placing an image **directly** into the content using HTML.
- HTML's `<img>` tag is **empty/self-closing**, meaning it doesn't need a closing tag.
- Images add **visual appeal**, help in **storytelling**, and increase **user engagement**.

Basic Image Tag Structure

Syntax:

```

```

- **src:** Location of the image file
- **alt:** Descriptive text if the image fails to load
- The alt attribute is crucial for:
 - Screen readers (accessibility)
 - **SEO**
 - Error fallback

Controlling Image Size

➤ You can resize images using the width and height attributes.

➤ Syntax:

```

```

➤ Dimensions can also be controlled via **CSS** for better styling.

➤ Resizing helps maintain **layout consistency** and **loading performan**

Image as a Link

➤ You can nest an `<img>` tag inside an `<a>` tag to make the image cli

➤ **Syntax:**

```
<a href="https://openai.com">
```

```
    
```

```
</a>
```

➤ This method is often used for **logos, ads, or gallery previews.**
